How fpa can help you

sexual health direct is a nationwide service run by fpa. It provides:
- confidential information and advice on contraception, sexually transmitted infections, planning a pregnancy, pregnancy choices and sexual wellbeing
- details of contraception clinics, sexual health clinics and genitourinary medicine (GUM) clinics
- a wide range of leaflets on individual methods of contraception, common sexually transmitted infections, pregnancy choices, abortion and planning a pregnancy.

A final word

This leaflet can only give you basic information about sexual health. Information is based on the evidence and medical opinion available at the time this leaflet was printed. Different people may give you different information and advice on certain points.

Remember – contact your doctor, practice nurse or sexual health clinic if you are worried or unsure about anything.
What is oral sex?

Oral sex involves a person using their mouth, tongue and lips to stimulate a partner’s genitals. There are different types of oral sex, involving using your mouth and tongue to stimulate:
- a woman’s vagina, vulva and clitoris – known as cunnilingus, going down, giving head
- a man’s penis – known as fellatio, blow job, going down, giving head
- a person’s anus – known as rimming.

Many people give and receive oral sex as an enjoyable part of their sex life. There is no risk of pregnancy from having oral sex but some sexually transmitted infections can be passed on this way.
How safe is oral sex?

It is very difficult to give a definite answer to this, as it can be hard to find out exactly how a sexually transmitted infection was passed on. What we do know is:

- some infections are spread more easily through oral sex than others
- oral sex is generally safer than unprotected (that is, without a condom) vaginal or anal sex
- for most infections, being given (receiving) oral sex is probably safer than giving oral sex because you are less likely to be exposed to genital fluids
- infections can be passed on through oral sex even if there are no signs or symptoms of the infection
- there are ways of making oral sex safer.

What infections can be passed on through oral sex?

This leaflet covers the main infections that people ask about which can be passed on through oral sex. The most commonly passed on are:

- herpes simplex
- gonorrhoea
- syphilis.

Infections less frequently passed on include:

- chlamydia
- HIV
- hepatitis A
Body fluids. The viruses or bacteria that cause some infections can be passed on in infected body fluids (such as semen, pre-ejaculatory fluid (pre-cum), blood, or vaginal secretions). Infection can occur if infected body fluids come into contact with:

- sores, cuts, ulcers, or inflamed cells on the lips, mouth, genitals or anus
- the membrane of the eye
- the cells of the throat.

This contact allows the viruses or bacteria to enter the blood stream or to live in the cells. Chlamydia, gonorrhoea, hepatitis B, hepatitis C, HIV and syphilis can be passed on in this way.

Ingestion (eating). Hepatitis A is an infection of the gut that is passed on through infected faeces (shit, poo). It can be passed on through stimulating a partner’s anus even if their anal area looks clean.

Can I get an infection if I give oral sex to a partner?

Yes, you could be at risk of an infection if you have licked, kissed or sucked a partner’s penis, vulva, vagina or anus. Infections that are more easily passed on this way include gonorrhoea, herpes simplex, hepatitis A, hepatitis B and syphilis, although others can be passed on too.

If your partner has an infection they are more likely to pass it on to you if:

- you have a sore throat or sores, cuts, ulcers or inflamed skin around or on your lips, or in your mouth
How will I know if I get an infection through giving someone oral sex?

Many people do not get any signs and symptoms if they get an infection this way. The signs and symptoms can include:
- a sore throat
- blisters or sores in the mouth or on the lips
- signs and symptoms of hepatitis (see How will I know if I’ve caught a sexually transmitted infection? on page 15).

How can I help protect myself against infections during oral sex?

- Use a male or female condom, or a dam to cover the anus or female genitals (see What is a dam? on page 14). If you are not sure how to use male or female condoms correctly visit www.fpa.org.uk or call FPA’s helpline (see How FPA can help you, on the back cover). Spermicides should not be used with condoms.
- Avoid oral sex if you or your partner:
  - has a sexually transmitted infection
  - has sores, cuts, ulcers, blisters, warts or rashes around the genitals, anus or mouth
  - has any unhealed or inflamed piercings in the mouth or genitals
  - has a throat infection.
- Avoid giving oral sex to a woman who is menstruating (has her period).
- Avoid brushing or flossing your teeth shortly before or after giving someone oral sex, as this can cause bleeding in the mouth.
- Avoid getting semen or vaginal fluid in your eyes.

Vaccinations against hepatitis A and hepatitis B will help protect against infection and may be available on the NHS for some people. Brushing your teeth or using mouthwash before and/or after oral sex does not protect you against getting or passing on infections.
chlamydia, gonorrhoea, hepatitis B and HIV.

Pre-ejaculatory fluid (pre-cum) can also carry infection, so you could be at risk if your partner’s pre-cum gets in your mouth, even if he doesn’t ejaculate in your mouth.

If you ejaculate into a partner’s mouth, this does not increase the risk of an infection being passed on to you.

What if my partner has HIV and he ejaculates in my mouth?

If your partner is HIV positive and ejaculates in your mouth, you have a small risk of getting HIV. The risk depends on how much active HIV infection is in his bloodstream, and whether he has other sexually transmitted infections which cause discharge or ulcers. It also depends on whether you have any cuts, sores or ulcers in your mouth or on your lips.

If you are worried after having sexual contact with an HIV positive partner, you can go to a genitourinary (GUM) clinic, a sexual health clinic or an A&E department. The doctor or nurse will assess your situation to see whether taking anti-HIV drugs (known as Post Exposure Prophylaxis, PEP) would be helpful for you. PEP is more effective the sooner it is used. The latest it can be given is 72 hours after the oral sex happened. To find your nearest clinic see How can I find my nearest service? on page 18.

PEP is not considered necessary:
- after performing oral sex on a woman
- if there has not been ejaculation in the mouth, even if your partner is HIV positive.

What if my partner has genital herpes or a cold sore?

Genital herpes blisters and cold sores (which occur around the mouth and nose) are both caused by the herpes simplex virus. Oral sex is a very common way for the herpes simplex virus to pass from one person to another. It can pass on even if there are no sores or blisters visible at the time.

If your partner has the herpes simplex virus in the genitals, this can pass to your mouth or throat if you give them oral sex, and you may get a cold sore(s). The herpes virus doesn’t spread through your body from your mouth to your own genitals, although during your very first episode of herpes it is possible to transfer it on your fingers if you touch the cold sore and then your genitals.

If your partner is infected with the herpes simplex virus around the mouth (which can give them a cold sore) and gives you oral sex, the virus can pass to your genitals.

What if my partner ejaculates (comes) in my mouth?

The exact risk of infection is not known. If he has an infection that can be passed on through semen or blood (which can be present in semen) you are probably at more risk if he ejaculates in your mouth. The risk is probably the same whether you swallow the semen or spit it out. The more time his penis and/or semen is in your mouth, the greater the risk. Infections passed on through semen include chlamydia, gonorrhoea, hepatitis B and HIV.

Pre-ejaculatory fluid (pre-cum) can also carry infection, so you could be at risk if your partner’s pre-cum gets in your mouth, even if he doesn’t ejaculate in your mouth.

If you ejaculate into a partner’s mouth, this does not increase the risk of an infection being passed on to you.
When you receive oral sex, infections can pass to you if your partner has a sexual infection that can give them blisters or sores on the lips or in the mouth, or a sore throat, or if blood from your partner’s mouth or lips gets into your body.

It is easier for the infection to pass to you if you have sores, cuts, ulcers or inflamed skin around your genitals and anal area.

Infections that can be passed on by receiving oral sex include herpes, gonorrhoea, syphilis, chlamydia, hepatitis B and HIV.

**Can I get HIV from my partner’s saliva?**

Although it is possible to detect HIV in urine and saliva, the level of virus in these fluids is thought to be too low to be infectious. In addition, saliva contains protective substances which reduce the likelihood of the virus being passed on. But if the saliva has blood in it, from cuts in the mouth for example, or from unhealed piercings, then this can make infection possible.

Gums sometimes bleed after you brush your teeth, so try to avoid brushing your teeth immediately before or after oral sex.

**Am I more at risk if my partner has her period?**

If a woman has an infection that can be passed on through blood then there will be higher risk if you give her oral sex when she has her period. The infection will be more likely to pass to you if you have any sores, cuts, ulcers or inflammation in or around your mouth. Infections passed on through blood include hepatitis B, hepatitis C and HIV.

**Can oral sex give you cancer in your mouth or throat?**

Research is currently looking at the link between oral sex and mouth and throat cancer. Mouth and throat cancer has been linked to some types of a virus called human papilloma virus (HPV), which can be passed on through sexual contact, including oral sex. These are not the same types of HPV that cause genital warts.

Most proven causes of mouth and throat cancer are due to smoking and chewing tobacco.

**Can I get an infection if my partner gives me oral sex?**

Yes, you could be at risk of an infection if a partner has licked, kissed or sucked your penis, vulva, vagina or anus. You will not be exposed to their genital fluids, so it is thought that the risk of getting an infection this way is lower than if you perform oral sex on someone.

When you receive oral sex, infections can pass to you if your partner has a sexual infection that can give them blisters or sores on the lips or in the mouth, or a sore throat, or if blood from your partner’s mouth or lips gets into your body.

It is easier for the infection to pass to you if you have sores, cuts, ulcers or inflamed skin around your genitals and anal area.

Infections that can be passed on by receiving oral sex include herpes, gonorrhoea, syphilis, chlamydia, hepatitis B and HIV.
**How will I know if I’ve caught a sexually transmitted infection?**

Not everyone who has a sexually transmitted infection has signs and/or symptoms. Sometimes these don’t appear for months and sometimes they go away but you can still have, and pass on, the infection.

If you have had unprotected oral, vaginal or anal sex and notice any of the following, you should seek advice:
- Itches, rashes, lumps or blisters in or around the genitals, vagina, anus or mouth
- Unusual discharge from the vagina
- Discharge from the penis
- Irritation, pain or burning when you pass urine
- Pain and/or bleeding during or after sex
- Bleeding between periods (including women who are using hormonal contraception)
- Pain in the testicles or lower abdomen
- A sore throat.

Hepatitis A, hepatitis B and hepatitis C affect the liver, not the genitals. Signs and/or symptoms of hepatitis A, hepatitis B and hepatitis C may include:
- Flu-like illness, such as fever, general aches and headaches
- Tiredness and feeling sick, sometimes with vomiting and diarrhoea
- Dark coloured urine and/or pale faeces
- Jaundice (yellowing of the skin and/or eyes).

Sexual contact is not a common way of getting or passing on hepatitis C, but we know that it does happen.

---

**What is a dam?**

A dam (used to be called a dental dam) is a latex or polyurethane (soft plastic) square, about 15cm by 15cm, which you can use to cover the anus or female genitals. It acts as a barrier to help prevent sexually transmitted infections passing from one person to another.

You can get dams at some genitourinary (GUM) and sexual health clinics, some contraception services, through mail order, or pharmacies may order them for you. They are available in different flavours.

**How to use a dam**

- Cover the genital area (vulva, vagina or anus) with the dam before there is any contact with the mouth.
- Hold it in place during oral sex.
- It doesn’t matter which side you put against the vulva or anus, but do not turn the dam over once you’ve started using it.
- Don’t move a dam from the anus to the vulva because bacteria that are harmless in the anus can cause infection in the vagina.
- Do not use oil-based lubricants, such as moisturiser, with latex products as this can damage them. You can use water-based lubricants with latex dams, and it is safe to use oil-based lubricants with polyurethane dams.
- Use a new one each time you have oral sex. Never re-use a dam.
- Dams cannot be used for penetrative sex. If you don’t have a dam, you can make one out of a condom.
Even if you don’t have any signs and/or symptoms you may wish to seek advice or have a check-up, particularly if:

- you have had unprotected sex, including oral sex, with a new partner recently
- you, or your partner, have sex with other people without using a condom
- your partner has any symptoms.

Can sexually transmitted infections be treated?

Most sexually transmitted infections are easily treated but treatment should be started as soon as possible. Some infections, such as HIV, never leave the body and cannot be cured. There are drugs available that can reduce the symptoms and help prevent or delay the development of HIV associated illnesses and AIDS.

If left untreated, many sexually transmitted infections can be painful or uncomfortable, can permanently damage your health and fertility, and can be passed on to your partner(s).

Where can I go for help and advice about sexually transmitted infections?

You can get confidential help and advice, and all tests and treatments, at a genitourinary medicine (GUM) or sexual health clinic. Your general practice, contraception clinics, young people’s services and some pharmacies may also provide testing for some infections. If they can’t provide what you need, they should be able to give you details of the nearest service that can.

You can also call fpa’s helpline on 0845 122 8690 or visit www.fpa.org.uk for free advice and information, and to find your nearest service.

Other organisations that can offer information and advice include:

- THT Direct (helpline 0845 122 1200, www.tht.org.uk) Information on HIV, AIDS and sexual health
- Herpes Viruses Association (helpline 0845 123 2305, www.herpes.org.uk) Information on herpes
- Sexual Health Line (helpline 0800 567 123, www.playingsafely.co.uk) Information on sexually transmitted infections and sexual health services

Will I have to pay for tests and treatments?

All advice, information and tests are free through NHS services. Treatment is also free unless you go to your general practice when you may have to pay a prescription charge for the treatment. Vaccinations against hepatitis A and hepatitis B are available in certain circumstances on the NHS, or can be obtained privately.
How can I find my nearest service?

- You can find out about all clinics from sexual health direct, run by fpa, on 0845 122 8690 or at www.fpa.org.uk. You can also call fpa in Scotland and Northern Ireland (see back cover).
- You can find details of all services including general practices and pharmacies at www.nhsdirect.nhs.uk. In England and Wales you can call NHS Direct on 0845 46 47, in Scotland NHS 24 on 08454 24 24 24.
- You can also get details of your nearest contraception, GUM or sexual health clinic from a telephone directory, health centre, local pharmacy, hospital, midwife, health visitor or advice centre.
- You can get details of GUM or sexual health clinics from the Sexual Health Information Line on 0800 567 123 or at www.playingsafely.co.uk.
- You can find details of young people’s services from Brook on 0800 0185 023, or at www.ruthinking.co.uk, or if you’re under 18 you can call Sexwise on 0800 28 29 30.
How fpa can help you

sexual health direct is a nationwide service run by fpa. It provides:

- confidential information and advice on contraception, sexually transmitted infections, planning a pregnancy, pregnancy choices and sexual wellbeing
- details of contraception clinics, sexual health clinics and genitourinary medicine (GUM) clinics
- a wide range of leaflets on individual methods of contraception, common sexually transmitted infections, pregnancy choices, abortion and planning a pregnancy.
