What is cancer?

1 in 4 people may get cancer in their lives.

What causes cancer?

We all have cells in our body. All cells have a job to do. For example, some cells make blood, some cells fight illness.

Cells can go wrong. They begin to split up too much. This can mean that a lump begins to form.

Not all lumps are cancer. Doctors sometimes remove these lumps. Lumps sometimes break up and spread to other parts of the body.
